

FIG. 1 is a block diagram of a computer system 100 in accordance with the present invention. The computer system 100 includes a processing unit 120, a system memory 130, and various input/output interfaces. The system memory 130 is divided into system ROM 131, BIOS 133, system RAM 132, operating system 134, application programs 135, other program modules 136, and program data 137. The processing unit 120 is connected to the system memory 130 via a bus 121. The processing unit 120 is also connected to various input/output interfaces, including a video interface 122, a user input interface 123, a removable non-volatile memory interface 124, a non-volatile memory interface 125, a network interface 126, and an output peripheral interface 127. The output peripheral interface 127 is connected to a monitor 191, a printer 196, and speakers 197. The network interface 126 is connected to a local area network 171 and a wide area network 173. The wide area network 173 is connected to a remote computer 180 and remote application programs 185. The user input interface 123 is connected to a keyboard 162, a pointing device 161, and a microphone 163. The removable non-volatile memory interface 124 is connected to a removable non-volatile memory device 151, which is connected to a hard disk drive 152 and a floppy disk drive 155. The non-volatile memory interface 125 is connected to a non-volatile memory device 156. The program data 137 is connected to a database 141, which is connected to a table 142, a view 143, a stored procedure 144, and a trigger 145. The application programs 135 are connected to a table 146, a view 147, a stored procedure 148, and a trigger 149. The other program modules 136 are connected to a table 150, a view 151, a stored procedure 152, and a trigger 153. The operating system 134 is connected to a table 154, a view 155, a stored procedure 156, and a trigger 157.
